SVM

December 19, 2023

1 Multiclass Support Vector Machine exercise

Complete and hand in this completed worksheet (including its outputs and any supporting code outside of the worksheet) with your assignment submission. For more details see the assignments page on the course website.

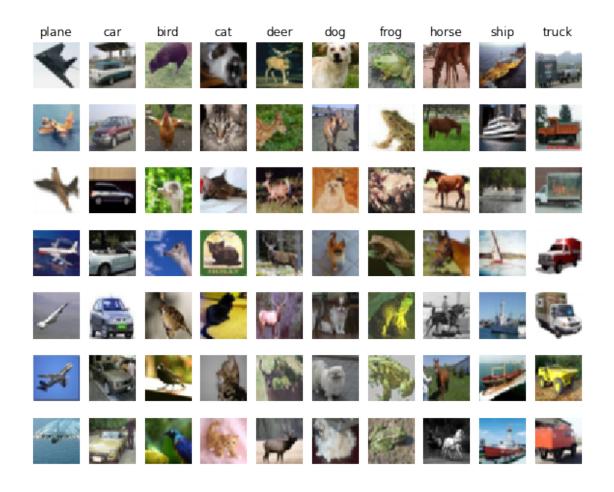

In this exercise you will:

- implement a fully-vectorized loss function for the SVM
- implement the fully-vectorized expression for its analytic gradient
- check your implementation using numerical gradient
- use a validation set to tune the learning rate and regularization strength
- optimize the loss function with SGD
- visualize the final learned weights
- SVM
- •
- ...
- SGD **

```
[1]: # Run some setup code for this notebook.
     import random
     import numpy as np
     from cs231n.data_utils import load_CIFAR10
     import matplotlib.pyplot as plt
     # This is a bit of magic to make matplotlib figures appear inline in the
     # notebook rather than in a new window.
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # Some more magic so that the notebook will reload external python modules;
     # see http://stackoverflow.com/questions/1907993/
     \rightarrow autoreload-of-modules-in-ipython
     %load ext autoreload
     %autoreload 2
```

1.1 CIFAR-10 Data Loading and Preprocessing

```
[2]: # Load the raw CIFAR-10 data.
     cifar10_dir = 'cs231n/datasets/cifar-10-batches-py'
     # Cleaning up variables to prevent loading data multiple times (which may cause_
     →memory issue)
     try:
       del X_train, y_train
       del X_test, y_test
       print('Clear previously loaded data.')
     except:
       pass
     X_train, y_train, X_test, y_test = load_CIFAR10(cifar10_dir)
     # As a sanity check, we print out the size of the training and test data.
     print('Training data shape: ', X_train.shape)
     print('Training labels shape: ', y_train.shape)
     print('Test data shape: ', X_test.shape)
     print('Test labels shape: ', y_test.shape)
    Training data shape: (50000, 32, 32, 3)
    Training labels shape: (50000,)

1.2 SVM Classifier

Your code for this section will all be written inside cs231n/classifiers/linear_svm.py.

As you can see, we have prefilled the function svm_loss_naive which uses for loops to evaluate the multiclass SVM loss function.

```
[7]: # Evaluate the naive implementation of the loss we provided for you:
    from cs231n.classifiers.linear_svm import svm_loss_naive
    import time

# generate a random SVM weight matrix of small numbers
W = np.random.randn(3073, 10) * 0.0001

loss, grad = svm_loss_naive(W, X_dev, y_dev, 0.000005)
    print('loss: %f' % (loss, ))
```

loss: 8.715718

The grad returned from the function above is right now all zero. Derive and implement the gradient for the SVM cost function and implement it inline inside the function svm_loss_naive. You will find it helpful to interleave your new code inside the existing function.

To check that you have correctly implemented the gradient correctly, you can numerically estimate the gradient of the loss function and compare the numeric estimate to the gradient that you computed. We have provided code that does this for you: grad SVM
svm_loss_naive

```
[8]: # Once you've implemented the gradient, recompute it with the code below
     # and gradient check it with the function we provided for you
     # Compute the loss and its gradient at W.
     loss, grad = svm_loss_naive(W, X_dev, y_dev, 0.0)
     # Numerically compute the gradient along several randomly chosen dimensions, and
     # compare them with your analytically computed gradient. The numbers should,
      \rightarrow match
     # almost exactly along all dimensions.
     from cs231n.gradient_check import grad_check_sparse
     f = lambda w: svm_loss_naive(w, X_dev, y_dev, 0.0)[0]
     grad_numerical = grad_check_sparse(f, W, grad)
     # do the gradient check once again with regularization turned on
     # you didn't forget the regularization gradient did you?
     loss, grad = svm_loss_naive(W, X_dev, y_dev, 5e1)
     f = lambda w: svm_loss_naive(w, X_dev, y_dev, 5e1)[0]
     grad_numerical = grad_check_sparse(f, W, grad)

Inline Question 1

It is possible that once in a while a dimension in the gradcheck will not match exactly. What could such a discrepancy be caused by? Is it a reason for concern? What is a simple example in one dimension where a gradient check could fail? How would change the margin affect of the frequency of this happening? Hint: the SVM loss function is not strictly speaking differentiable

SVM

YourAnswer: fill this in.

What could such a discrepancy be caused by? It could be because the Support Vector Machine (SVM) loss function is not derivable at some points.

Is it a reason for concern? We do not need to worry too much about this problem as it only occurs near a few discontinuous points and does not affect the overall training of the model very much.

What is a simple example in one dimension where a gradient check could fail? A simple example in one dimension is when the point is on the margin and it is not derivable.

How would change the margin affect of the frequency of this happening? If the margin value is set larger, meaning more points in the middle are on the margin, the loss function is not derivable and the frequency of this happening becomes more frequent. Conversely, the closer the margin value is to 0, the less frequent it is.

```
[9]: # Next implement the function sum_loss_vectorized; for now only compute the loss;

# we will implement the gradient in a moment.

tic = time.time()

loss_naive, grad_naive = svm_loss_naive(W, X_dev, y_dev, 0.000005)

toc = time.time()

print('Naive loss: %e computed in %fs' % (loss_naive, toc - tic))
```

Naive loss: 8.715718e+00 computed in 0.077950s Vectorized loss: 8.715718e+00 computed in 0.003051s difference: 0.000000

```
[10]: # Complete the implementation of sum loss_vectorized, and compute the gradient
      # of the loss function in a vectorized way.
      # The naive implementation and the vectorized implementation should match, but
      # the vectorized version should still be much faster.
      tic = time.time()
      _, grad_naive = svm_loss_naive(W, X_dev, y_dev, 0.000005)
      toc = time.time()
      print('Naive loss and gradient: computed in %fs' % (toc - tic))
      tic = time.time()
      _, grad_vectorized = svm_loss_vectorized(W, X_dev, y_dev, 0.000005)
      toc = time.time()
      print('Vectorized loss and gradient: computed in %fs' % (toc - tic))
      # The loss is a single number, so it is easy to compare the values computed
      # by the two implementations. The gradient on the other hand is a matrix, so
      # we use the Frobenius norm to compare them.
      difference = np.linalg.norm(grad_naive - grad_vectorized, ord='fro')
      print('difference: %f' % difference)
```

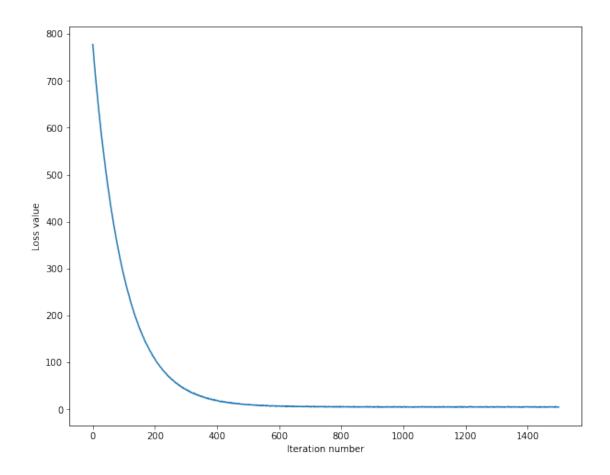

Naive loss and gradient: computed in 0.071703s Vectorized loss and gradient: computed in 0.002303s difference: 0.000000

1.2.1 Stochastic Gradient Descent

We now have vectorized and efficient expressions for the loss, the gradient and our gradient matches the numerical gradient. We are therefore ready to do SGD to minimize the loss. Your code for this part will be written inside cs231n/classifiers/linear_classifier.py.

SGD cs231n/classifiers/linear_classifier.py

```
[11]: # In the file linear_classifier.py, implement SGD in the function
      # LinearClassifier.train() and then run it with the code below.
      from cs231n.classifiers import LinearSVM
      svm = LinearSVM()
      tic = time.time()
      loss_hist = svm.train(X_train, y_train, learning_rate=1e-7, reg=2.5e4,
                            num iters=1500, verbose=True)
      toc = time.time()
      print('That took %fs' % (toc - tic))
     iteration 0 / 1500: loss 777.534716
     iteration 100 / 1500: loss 285.353977
     iteration 200 / 1500: loss 107.869149
     iteration 300 / 1500: loss 42.460724
     iteration 400 / 1500: loss 19.147295
     iteration 500 / 1500: loss 10.327860
     iteration 600 / 1500: loss 6.902737
     iteration 700 / 1500: loss 5.130443
     iteration 800 / 1500: loss 6.023793
     iteration 900 / 1500: loss 5.318926
     iteration 1000 / 1500: loss 5.079633
     iteration 1100 / 1500: loss 4.834523
     iteration 1200 / 1500: loss 5.203491
     iteration 1300 / 1500: loss 5.400227
     iteration 1400 / 1500: loss 5.807908
     That took 6.269842s
[12]: # A useful debugging strategy is to plot the loss as a function of
      # iteration number:
      plt.plot(loss_hist)
      plt.xlabel('Iteration number')
      plt.ylabel('Loss value')
      plt.show()
```

training accuracy: 0.376082 validation accuracy: 0.379000

```
[15]: # Use the validation set to tune hyperparameters (regularization strength and # learning rate). You should experiment with different ranges for the learning # rates and regularization strengths; if you are careful you should be able to # get a classification accuracy of about 0.39 on the validation set.

# Note: you may see runtime/overflow warnings during hyper-parameter search. # This may be caused by extreme values, and is not a bug.

```
[17]: # Evaluate the best sum on test set
    y_test_pred = best_svm.predict(X_test)
    test_accuracy = np.mean(y_test == y_test_pred)
    print('linear SVM on raw pixels final test set accuracy: %f' % test_accuracy)
```

linear SVM on raw pixels final test set accuracy: 0.362000

```
[18]: # Visualize the learned weights for each class.
# Depending on your choice of learning rate and regularization strength, these
    →may
# or may not be nice to look at.
w = best_svm.W[:-1,:] # strip out the bias
w = w.reshape(32, 32, 3, 10)
w_min, w_max = np.min(w), np.max(w)
classes = ['plane', 'car', 'bird', 'cat', 'deer', 'dog', 'frog', 'horse', 
    →'ship', 'truck']
```

```
for i in range(10):
    plt.subplot(2, 5, i + 1)

# Rescale the weights to be between 0 and 255
    wimg = 255.0 * (w[:, :, :, i].squeeze() - w_min) / (w_max - w_min)
    plt.imshow(wimg.astype('uint8'))
    plt.axis('off')
    plt.title(classes[i])
```

Inline question 2

Describe what your visualized SVM weights look like, and offer a brief explanation for why they look they way that they do.

YourAnswer: fill this in

What your visualized SVM weights look like The visualized SVM weights look like the average of the sample profiles for that class. And most of them are symmetric.

Offer a brief explanation for why they look they way that they do: This is because a linear classifier learns a template for each category which provides an average match to the data. For example, if dogs have eyes and cars don't have eyes, then the dog weights will reinforce the dog eye weights, which means that the dog weights will reinforce the dog-specific features.
